# Kessler's Little Helper

Storyboard:
Ah, humanity. Another civilization that has discovered rockets and immediately started throwing garbage into orbit. Failure upon failure in launching their spacecraft, and their decaying satellites are slowly sabotaging their own effort with the amount of junks now orbiting their planet.

In the far side of Andromeda, the Rogbhbrol's greatest minds watched on. Humanity would mark the 5,329,164,291th race that fails to reach spacefaring technology; and oh how they've yearned for fellow intelligent species for millennias. Thus Roghbrol embarked on a new mission, dubbed:

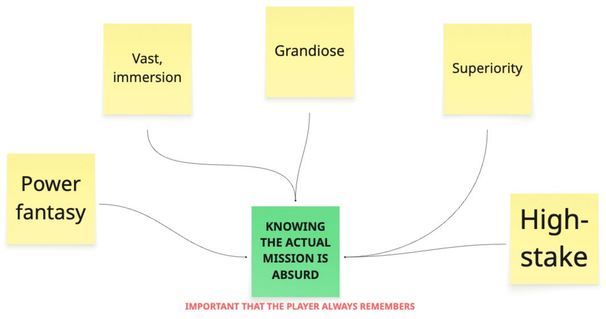
***"Project Un-Terra-pped Mankind."***

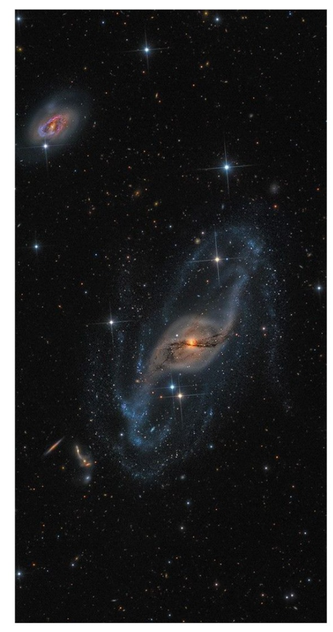
You are a freshgradute from Roghbrol's academy, holding the prestigious title of Space Fabric Engineer and Gravity Manipulator. You are now tasked to watch over Mankind's solar system and see if you could conspicuously direct large enough objects to influence the junks around the earth.

P.S: Remember to not accidentally fling that into the planet itself. And make it seem like an accident. They're not ready for our presence

## TASK 1: What is the game trying to make me experience?

**IMAGINE THIS GUY, saying things like**





---

**TASK 2: Define the core activity of your concept.**

CORE LOOP:

The player manipulates celestial objects to capture and redirect Earth's orbital debris, constantly adjusting their trajectory to clean up humanity's mess without accidentally destroying the planet. As their abilities grow, they experiment with increasingly massive objects and develop more effective ways to manage the debris.

Gravity manipulation and orbital problem solving

*Player does X → notices Y → decides Z → receives feedback → repeats*

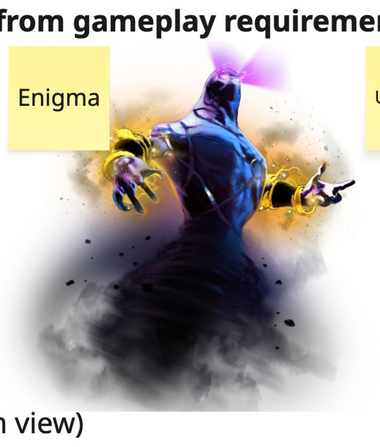
Loop 1.
*Player nudges a celestial object → notices that it's off-course → decides to correct its path → Player observes the consequence → decides whether the result is useful → Player manipulates again → repeats*

Loop 2.
*Player gains level → receives feedback → the game shows the effect (e.g. move a heavier celestial body) → Player tries the new power → decides to refine their strategy → repeats to loop 1*

---

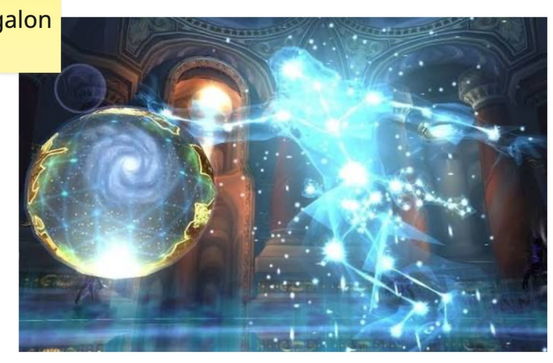
**TASK 3: Identify: Visual solution from gameplay requirement**

Enigma



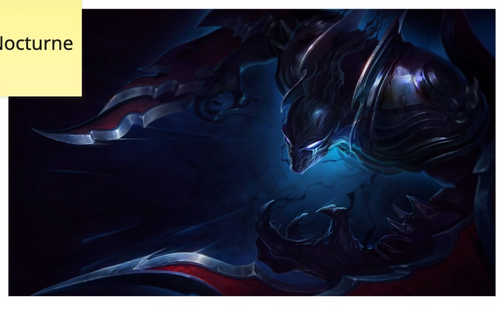
Unbidden

Algalon



Archon

Nocturne

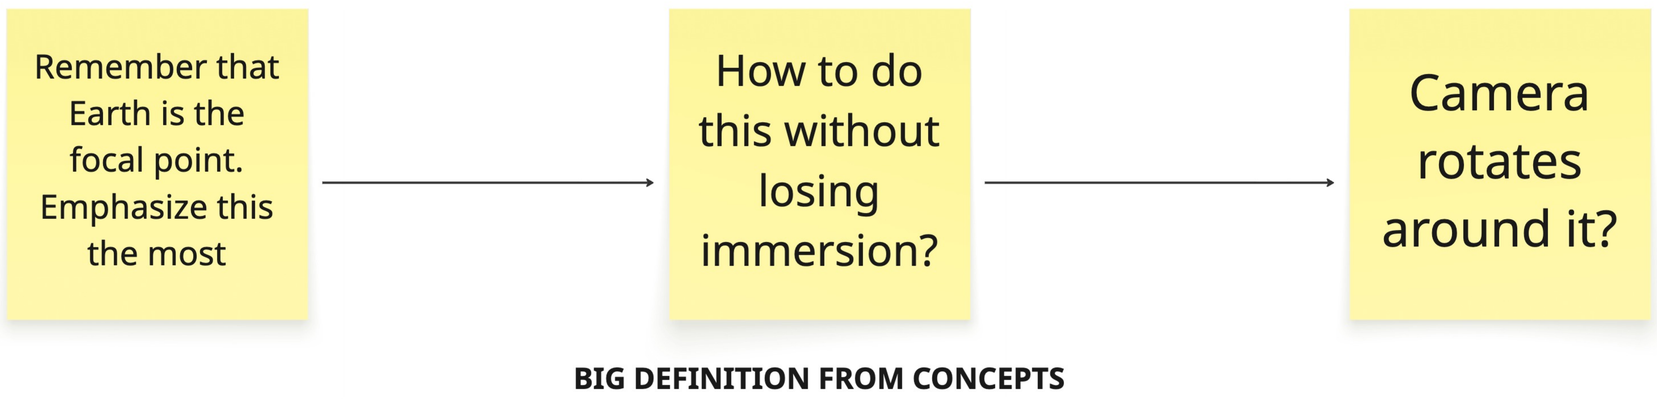


What's interactable?
- Celestial objects
- The map itself (drag & zoom view)
- Really, that's it

What information is important to gameplay?
- Orbital path of selected object (!!) → Let's not have the player do math and physics. But showing all at once might clutter the screen. All vs On-click as toggleable setting(?)
- WHICH of the objects ARE interractable (!!) → Having to guess would be very tedious
- Earth's orbit cleanliness percentage (!!) → Win/Lose condition gauge. 100% orbital coverage means earth is doomed, 0% is player's victory. Feedback to show that the player is doing something and numerical measure for their progress.
- Level (!) → Game still plays well without this, but could work as an anticipation builder.
- Level + Title that defines their upgrades (!?) → Might be a way to communicate what meaningful things they have gained. This is assuming the user to actually remember what each title does, however. Could be easier than attaching number to power? ITERATE
- Milestone (!?) → Same as orbit cleanliness percentage, although this is a non-MVP feature probably better thought about later

What helps set comprehension/mood?
- Camera may zoom out very far
- Realism-style graphics → A believable representation of space
- Non-silly Roghbrol sprites. They should appear powerful, ancient/advanced, completely serious. No business caring about our mortal bs → Look up: Enigma (Dota 2), Algalon (WoW), Archon (StarCraft 2), Nocturne (LoL), Unbidden (Stellaris)
- One true light source (sun)
- Quiet atmospheric. Perhaps just low rumbles and occasional whoosh?

Purely aesthetic
- Non-planetary bodies → I'd be damned trying to mimic every single asteroid shape despite the realism style. PR sentence if a mentor is reading this: Asteroids use a limited visual vocabulary while preserving enough variation to avoid feeling repetitive.
- Nebula background
- Accurate per-planet coloring → Hopefully order and size communicates enough what the planet is



**BIG DEFINITION FROM CONCEPTS GAMEPLAY AND VISUAL DECISION**

*The game wants the player to experience the grandeur and seriousness of an epic science-fiction mission while constantly being reminded that said mission is ridiculous*
